

What is my cattle's carbon footprint? Meet Farmer Joe!

Farmer Joe has become increasingly concerned about the impact his cattle may be having on the environment. He has quite a lot of cattle on his farmland, but what is the carbon footprint of each one?

One cow = 300 kg of edible meat

1kg of beef = 12.65 kg of CO₂e

If a small family car emits 87g/km of CO₂e, how many km (to the nearest km) could be driven with the same carbon emissions as one cow?

Answer:

What greenhouse gasses might be included in the carbon footprint?

Where are they from?
